

QUICKBAR

Smart and cost efficient solution for cabinet construction

QUICKBAR

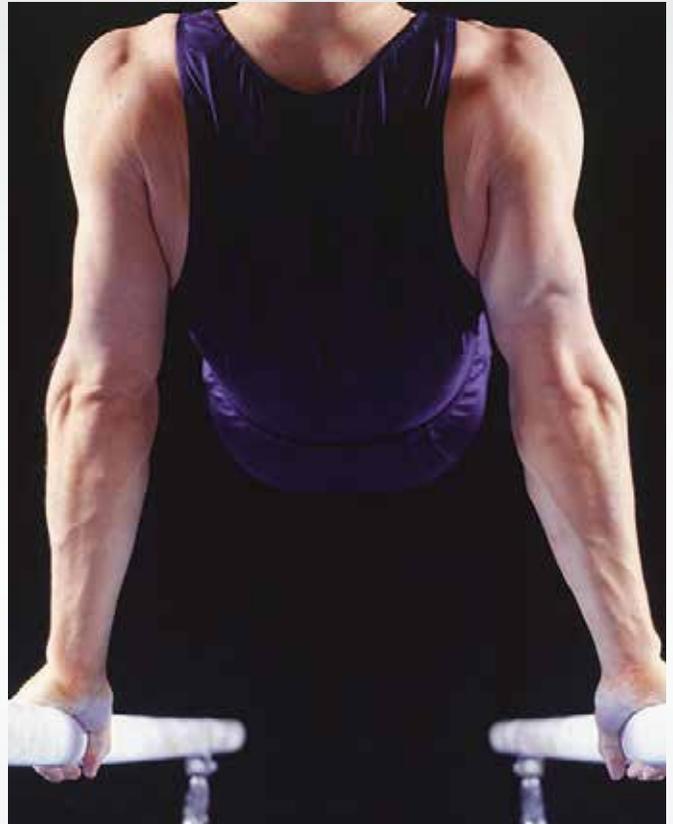

Smart and cost efficient solution for cabinet construction

FEATURES

Quickbar is the up-to-date solution for the construction of bottom cabinets for kitchen and bathroom. The necessity to keep the top of these cabinets as open as possible to accommodate sinks, stoves and other equipments was always a challenge for the designer. With Quickbar, the top bar in roll formed steel, the construction is simplified, the strength and discretion of the top part is enhanced and the solution is proposed at a very competitive price. Quickbar is equipped as a standard with back wall holder and for larger versions with fixing points for central posters.

The product range is realised with state-of-the-art equipment: high precision stamping allow the customisation of fixing and back wall holder positions in line, and the modern roll forming equipment generates high precision profiles in constant quality at unbeatable costs.

BENEFITS

The use of a roll-formed steel profile enables a stable and stiff cabinet construction.

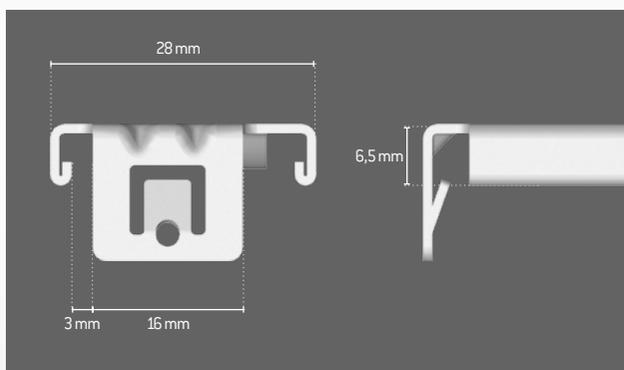

Quickbar stands out with several important features:

- *Very compact construction to allow full use of the volume for drawers or innerware equipment;*
- *Slim design for ease of insertion of top equipment like sinks or hobs;*
- *The profile is equipped with back-wall holders as a standard;*
- *Upon request, specific fixing points for central posters can be supplied as standard*
- *Large choice of finishes;*
- *High dimensional precision and supply to exact required dimension;*
- *Bur free stamping and rounded edges for safety and stability;*
- *Packaging according to customer requirements.*

FUNCTIONAL DIMENSIONS

Quickbar has a compact section of 28x6,5mm only and can be realised for cabinets from 300mm to 1200mm with tolerances of +/- 0,1mm. Shorter versions are currently under development. The nominal dimensions can be adapted to the panel thickness (16/18/19) used for the cabinet construction. Dimensions outside of the standard modules can be done without problems for bathroom or wardrobe applications (back stiffener).

FINISHES

Quickbar are realised in high quality steel and guarantee constant quality and finish.

The different standard finishes currently available are: **zinc coated, nickel mat coated, titan grey, white, black**

The Quickbloc holder can be supplied in white, light grey or black.

FIXING VARIANTS

Quickbar can be supplied in three fixing variants: Top edge fixing, side fixing, tool less side fixing

Tool less fixing with Quickbloc

A patented plastic bloc with tool less features can be clipped to the cabinet inside and the Quickbar locks the solution into place.

Side fixing

The Quickbar has angled bracket integrated into its design to screw the bar onto the inner sides of the cabinet with wooden screws or euro screws.

Top fixing

The no-frills fixing method simply screwed onto the top edge of the cabinet is very cost effective. The 1mm built-up is barely visible in real life.

TECHNICAL PERFORMANCE

Quickbar is a strong but discrete top connector for bottom cabinets or as a side wall stiffener.

The product is designed, so that cabinets with 35kg total weight can be handled on the bars without any problem to be put in place during the installation process.

ALTERNATIVE APPLICATIONS

Kitchen bottom cabinet construction

In this application, the quickbar is normally fixed flat to reduce the impact on the available inner height of the cabinet, leaving still enough cut out to accommodate all modern sinks and appliances.

Bathroom cabinets

In this application, the bar can be used horizontally, but also tilted by 90° to increase the available space, including for latest generation sinks, and/or to be able to fix front plinths under the sink with a cost effective and safe method.

Kitchen pantry units

To counteract the tendency of side panels on high kitchen units to bow out, Quickbar can be used on the back of the cabinet as a side wall stiffener. The Quickbloc block allows for very easy assembly.

Wardrobe

With modern flat-pack wardrobes, the bowing of the side panels must often be compensated. With Quickbar, this is feasible in an easy to assemble and cost effective way.

VISION & MISSION

Well-equipped and well-functioning furniture in all price categories should contribute to wellbeing all over the world in the 21st century. Rennerich are contributing with smart sustainable solutions at the right price to achieve customer expectations in that field.

PRODUCTION

With over 70 employees in two plants with a total surface of 8.800 m², Rennerich are producing every year several millions of linear meters of roll formed furniture accessories like wardrobe tubes, sliding door profiles, sliding door handles and other furniture construction profiles. State-of-the-art equipment for stamping, roll forming and packaging ensure best-in-class performance.

QUALITY MANAGEMENT

The quality management applied by the company corresponds to the high expectations of the industry; quality is lived by the whole team. A tight and efficient organisation, performant equipment to the latest quality standards and clearly defined processes throughout the company ensure a constant quality level of all products and the respect of agreed lead times.

PORTFOLIO

Wardrobe tubes

Oval wardrobe tubes ensure orderly and safe storage of clothing in free-standing or walk-in wardrobes at leading manufacturers in Germany and worldwide.

Quickbar-EN - 05/2017

Sliding door mechanisms

Overslide sliding door mechanisms allow quick and practical access to wardrobe content with price conscious and quality leading manufacturers worldwide.

Handle profiles

The Grip sliding door handle portfolio convinces through large choice of shapes and finishes and constant quality, with standard designs or models made to customer requirement.

Connection bars

Quickbar is the innovative solution for the top connection of bottom cabinets in kitchen and bathroom applications. Compact, strong and available as tool less version for flat-pack furniture or for factory assembled furniture as well.

Rollforming

More than a decade of experience in roll forming components for the furniture industry and other applications have turned Rennerich into a leading company in that field.

Stamping

Stamped components in steel, from a simple bracket to complex components are part of the competency of Rennerich since the beginning of the activity in furniture applications and other industries as well.
